Figure 1 consists of two bar charts, (a) for 1995 and (b) for 1996. Each chart compares the number of adult female mites on two groups: 'W' (with ivermectin) and 'C' (control). The y-axis represents the number of adult female mites, ranging from 0 to 100. In 1995 (a), the 'W' group shows a significant reduction in mites compared to the 'C' group. In 1996 (b), the 'W' group also shows a significant reduction, but the 'C' group has a higher number of mites than in 1995.
